Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/553,607

Applicant(s)

BECKER ET AL.

Examiner

MATTHEW J. BROPHY

Art Unit

2191

Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 30 May 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-25, 28 and 29 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-25, 28 and 29 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☒ Notice of Draftperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-85/86)
Paper No(s)/Mail Date 6/18/2008, 7/09/2008
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

1. This office action is in response to amendment filed May 30, 2008.

Response to Amendment

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

1. Claims 29 is rejected under 35 U.S.C. 102(a) as being anticipated by PCT Patent Application Publication WO 03/005192 Reimer et al, hereinafter Reimer.

Regarding Claim 29, Reimer teaches: A computer-readable medium containing instructions for execution by a processor for the practice of a method for managing a computer system, the instructions being capable of causing a processor to: assign a service to a group of computers (**WO Page 4, Lines 23-27, "In this embodiment the method further comprises the steps of selecting the version of said at least one application adapted to the selected precon- figured operating system to be downloaded to the first server, downloading and installing the at least one application to the first memory location of the first server Further, the code means of the computer program product is arranged to make the computer perform the following steps: selecting the version of said at least one application adapted to the selected precon- figured operating system to be downloaded to**

the first server, downloading and installing the at least one application to the first memory location of the first server.”); shift a service that runs on a first computer of the group to run on a second computer in the group (WO Page 4, Lines 23-27, “In this embodiment the method further comprises the steps of selecting the version of said at least one application adapted to the selected precon- figured operating system to be downloaded to the first server, downloading and installing the at least one application to the first memory location of the first server Further, the code means of the computer program product is arranged to make the computer perform the following steps: selecting the version of said at least one application adapted to the selected precon- figured operating system to be downloaded to the first server, downloading and installing the at least one application to the first memory location of the first server.”); and re-install the operating system to the first computer (WO Page 15, Lines 14-15, “A server should be rebooted with another preconfigured operating system if, for instance, there is a need for more capacity in another preconfigured operating system.”). cyclically repeating the shifting and re-installing for all computers in the group thereby keeping the number of computers that are re-installing the operating system smaller than the number of computers that are not re-installing the operating system. (Pg 18, Ln 18-21, “ The invention also has the advantage that the life span of a server is increased due to the cycling of the servers (rebooting due to long up-time) and it also increases the security of the system since an uncorrupted version of the preconfigured operating system is downloaded each time the server is rebooted.”)

2.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 21-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over PCT Patent Application Publication WO 03/005192 Reimer et al, hereinafter Reimer in view of US Patent 5,551,047 Mori et al hereinafter Mori.

The text of these rejections not found in this office action can be found in the previous office action.

Regarding Claim 21, Reimer teaches: Method for managing a computer system, the system operating with a plurality of computers in at least one .group, the method comprising: assigning a service to a group set of computers-(WO Page 4, Lines 23-27, "In this embodiment the method further comprises the steps of selecting the version of said at least one application adapted to the selected precon- figured operating system to be downloaded to the first server, downloading and installing the at least one application to the first memory location of the first server Further, the code means of the computer program product is arranged to make the computer perform the following steps: selecting the version of said at least one application adapted to the selected precon- figured operating system to be

downloaded to the first server, downloading and installing the at least one application to the first memory location of the first server.”); shifting a service that runs on a first computer of the group to run on a second computer in the group (WO Page 4, Lines 23-27, “In this embodiment the method further comprises the steps of selecting the version of said at least one application adapted to the selected preconfigured operating system to be downloaded to the first server, downloading and installing the at least one application to the first memory location of the first server. Further, the code means of the computer program product is arranged to make the computer perform the following steps: selecting the version of said at least one application adapted to the selected preconfigured operating system to be downloaded to the first server, downloading and installing the at least one application to the first memory location of the first server.”); and re-installing the operating system to the first computer (WO Page 15, Lines 14-15, “A server should be rebooted with another preconfigured operating system if, for instance, there is a need for more capacity in another preconfigured operating system.”).

However, Reimer does not teach: testing the service in parallel operation on the first computer and on the second computer, and disabling the operation of the service by the first computer only if the test is successful. However, this limitation is taught by Mori. (e.g. Col. 1, Line 62-Col 2 Line 8, “In a fault-free situation, both nodes will pass the acceptance test with the results computed with their first used versions. In such a case, the primary node notifies the shadow of its success in the

acceptance test. Thereafter, only the primary node sends its output to the successor computing stations. However, if the primary node fails its test while the shadow node passes its test, the shadow node will take over the role of the primary as soon as it receives notice that the primary node has failed. If the primary node is completely lost, i.e., crashes, such that it is unable to notify the shadow node of the failure of its test, the shadow node will recognize the failure of the primary upon the expiration of a present time limit.”

And. E.g. Col. 3, Line 25-40, “The present method has several major characteristics. Parallel and asynchronous execution of multiple versions of a program module is performed with processors which are connected by a network. This includes the simple case where the same version of an application is allocated to multiple processors. There is no need for direct interaction between the processors during the execution of the same or different versions of the program module. The present method also utilizes two types of acceptance tests. One type is referred to as a result acceptance test for validation of the execution results of a program module and the other is referred to as an input acceptance test for validation and redundancy-detection of input data. These two types of acceptance tests are allocated to each processor together with a program module/version.”)

In addition, it would have been obvious to one of ordinary skill in the art to apply the acceptance test in Mori to the invention of Riemer, as the redundant acceptance

testing of Mori allows that: (Col 3. Ln 6-7) "The occurrence of faults causes little or no delay to the application's computation".

5. Claims 2-8, 10, 12-20 and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over US PG Publication 2003/0140267 Abbondanzio et al hereinafter Abbondanzio in view of PCT Application Publication WO 03/005192 Reimer et al. hereinafter Reimer and further in view of hereinafter US Patent 5,551,047 Mori et al hereinafter Mori.

The text of these rejections not found in this office action can be found in the previous office action.

Regarding Claims 1 and 28 Abbondanzio teaches: A method for managing a computer system, the computer system operating with a plurality of blades, the method comprising: detecting the presence of a new blade in the computer system **(Abbondanzio Paragraph [0007] The problems identified above are in large part addressed by a data processing system, referred to as a blade, comprising at least one main processor connected to a system bus, a system memory connected to the system bus and accessible to each of the main processors, a tamper mechanism, and a local service processor. The tamper mechanism is configured to change state each time the system is inserted into a slot in a rack enclosure. The local service processor on each blade is connected to the tamper mechanism and configured to update an insertion log upon detecting a change in state of the tamper mechanism. The insertion log provides a history of at least some rack insertions to which the system has been subjected. The system may**

include a non-volatile storage element accessible exclusively to the local service processor that contains the insertion log. The insertion log may include an insertion counter. In this embodiment, the local service processor is configured to increment the insertion counter upon each insertion. The local service processor may be further configured to issue an alert if the insertion counter exceeds a predetermined value. In one embodiment, the system further includes a battery backed real-time clock connected to the local service processor. The local service processor is configured to include real-time information corresponding to each insertion event in the insertion log. Each entry in the insertion log may include the identity of the rack enclosure and the geographical address of the slot of the corresponding insertion event. The local service processor may be configured to detect the tamper mechanism state and update the insertion following a power event such that the insertion log update is independent of configuring the data processing system with a boot image.”);

Abbandanzio does not explicitly teach: automatically installing an operating system on the new blade; automatically configuring the operating system based on a configuration used in an earlier detected blade; and copying a service that is running on the earlier detected blade to the new blade.

However, these limitations is taught by Reimer:

automatically installing an operating system on the new blade (WO Page 15, Lines 14-15, “A server should be rebooted with another preconfigured operating system if, for in- stance, there is a need for more capacity in another preconfigured

operating system.”); automatically configuring the operating system based on a configuration used in an earlier detected blade (WO Page 13 Lines 21-23, “Step 62:

The control unit CU uses the information obtained in step 61 to determine if a server needs to be rebooted and which preconfigured operating system should be used”); and copying a service that is running on an earlier detected blade to the new blade (WO Page 4, Lines 23-27, “In this embodiment the method further comprises the steps of selecting the version of said at least one application adapted to the selected precon- figured operating system to be downloaded to the first server, downloading and installing the at least one application to the first memory location of the first server Further, the code means of the computer program product is arranged to make the computer perform the following steps: selecting the version of said at least one application adapted to the selected precon- figured operating system to be downloaded to the first server, downloading and installing the at least one application to the first memory location of the first server.”). In addition, it would have been obvious to one of ordinary skill in the art at the time of the invention to combine the teachings of Abbondanzio with the OS updating techniques of Reimer, as Abbondanzio generally discusses the installation of Operating system and the update of software into new blades, while Reimer more specifically teaches a method of updating operating systems that allows the system to meet server demand.

None of the previous references teach: testing the service in parallel operation on the earlier detected blade and the new blade. However, this limitation is

taught by Mori. (e.g. Col. 1, Line 62-Col 2 Line 8, "In a fault-free situation, both nodes will pass the acceptance test with the results computed with their first used versions. In such a case, the primary node notifies the shadow of its success in the acceptance test. Thereafter, only the primary node sends its output to the successor computing stations. However, if the primary node fails its test while the shadow node passes its test, the shadow node will take over the role of the primary as soon as it receives notice that the primary node has failed. If the primary node is completely lost, i.e., crashes, such that it is unable to notify the shadow node of the failure of its test, the shadow node will recognize the failure of the primary upon the expiration of a present time limit."

And. E.g. Col. 3, Line 25-40, "The present method has several major characteristics. Parallel and asynchronous execution of multiple versions of a program module is performed with processors which are connected by a network. This includes the simple case where the same version of an application is allocated to multiple processors. There is no need for direct interaction between the processors during the execution of the same or different versions of the program module. The present method also utilizes two types of acceptance tests. One type is referred to as a result acceptance test for validation of the execution results of a program module and the other is referred to as an input acceptance test for validation and redundancy-detection of input data. These two types of acceptance tests are allocated to each processor together with a program module/version.")

In addition, it would have been obvious to one of ordinary skill in the art to apply the acceptance test in Mori to the invention of Riemer, as the redundant acceptance testing of Mori allows that: (Col 3. Ln 6-7) "The occurrence of faults causes little or no delay to the application's computation"

6. Claims 25 is rejected under 35 U.S.C. 103(a) as being unpatentable over PCT Application Publication WO 03/005192 Reimer et al. hereinafter Reimer as applied to claim 21 above in view of US PG Publication 2003/0140267 Abbondanzio et al. and further in view of hereinafter US Patent 5,551,047 Mori et al hereinafter Mori.

The text of these rejections not found in this office action can be found in the previous office action.

7. Claim 9 rejected under 35 U.S.C. 103(a) as being unpatentable over Abbondanzio et al hereinafter Abbondanzio in view of PCT Application Publication WO 03/005192 Reimer et al. hereinafter Reimer and further in view of hereinafter US Patent 5,551,047 Mori et al hereinafter Mori as applied to claim 6 above, and further in view of US PG Publication 2004/0255191 Fox et al hereinafter Fox.

The text of these rejections not found in this office action can be found in the previous office action.

8.

Claim 11 rejected under 35 U.S.C. 103(a) as being unpatentable over Abbondanzio et al hereinafter Abbondanzio in view of PCT Application Publication WO 03/005192 Reimer et al. hereinafter Reimer and further in view of hereinafter US Patent

5,551,047 Mori et al hereinafter Mori as applied to claim 1 above, and further in view of US PG Publication 2003/0046394 Goddard et al hereinafter Goddard.

3. The text of these rejections not found in this office action can be found in the previous office action.

Response to Arguments

4. Applicant's arguments filed May 30, 2008 have been fully considered but they are not persuasive.

In Remarks, Applicant Argues:

A.) Reimer does not disclose "testing the service in parallel operation on the first computer and on the second computer, and disabling the operation of the service by the first computer only if the test is successful,"

Examiner's Response:

This argument is moot due to new grounds of rejection.

In Remarks Applicant Argues:

B. Reimer does not disclose "cyclically repeating the shifting and re- installing for all computers in the group, thereby keeping the number of computers that are re-installing the operating system smaller than the number of computers that are not re-installing the operating system." Amended independent claim 29 recites "cyclically repeating the shifting and re- installing for all computers in the group, thereby keeping the number of computers that are re-installing the operating system smaller than the number of

computers that are not re-installing the operating system." Reimer does not disclose this recitation.

Examiner's Response:

Examiner respectfully disagrees. Page 18 of Reimer teaches the cycling of servers to extend a servers lifetime (i.e. "cyclically repeating the shifting and re- installing for all computers in the group"). Also, Page 11 to 12 teaches an embodiment of Reimer's invention that has 4 working servers and two spare servers (i.e. "thereby keeping the number of computers that are re-installing the operating system smaller than the number of computers that are not re-installing the operating system.")

In Remarks, Applicant Argues:

A. The references do not teach "automatically configuring the operating system based on a configuration used in an earlier detected blade." Applicants' amended independent claims 1 and 28 recite, among other things, "copying a service that is running on the earlier detected blade to the new blade." The Examiner correctly states that Abbondanzio does not teach this recitation. However, Reimer also does not teach this recitation. The previously-cited passage of Reimer is replicated below in its entirety.

Examiner's Response:

Examiner respectfully disagrees. First the use of "preconfigured operating systems" in Reimer, mean inherently, the operating system must be configured at some point on the server. In addition, Examiner further interprets the rebooting of a server and selecting a preconfigured operating system (with booting data for that operating system see e.g.

"step 65") , to be equivalent to applicant's "automatically configuring the operating system". Finally, the service copying from is anticipated by Reimer, in e.g. Page 16, Ln 16-17, " Step 76: An application configuration, in this example API (OS2), is selected to re- place the server S3.".

In remarks, Applicant Argues:

B. The references do not teach "testing the service in parallel operation on the earlier detected blade and the new blade,"

Examiner's Response:

This argument is moot due to new grounds of rejection.

Conclusion

5. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MATTHEW J. BROPHY whose telephone number is 571-270-1642. The examiner can normally be reached on Monday-Thursday 8:00AM-5:00 PM EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wei Zhen can be reached on (571) 272-3708. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>.
